

RNA World - A BOINC-based Distributed Supercomputer for High-Throughput Bioinformatic Studies to Advance RNA Research

Michael H.W. Weber
5th Pan-Galactic BOINC Workshop
Barcelona 2009

General Cell Architectures

(1) nucleolus, (2) nucleus, (3) ribosome, (4) vesicle, (5) rough endoplasmic reticulum (ER), (6) Golgi apparatus, (7) Cytoskeleton, (8) smooth endoplasmic reticulum, (9) mitochondria, (10) vacuole, (11) cytoplasm, (12) lysosome, (13) centrioles within centrosome

Genome Architectures: Information Content

Organism	Genome size (bp)	Year	Remarks
Phage Φ -X174	5,386	1977	first DNA genome ever sequenced
<i>Haemophilus influenzae</i>	1,830,000	1995	first genome of living organism
<i>Escherichia coli</i>	4,600,000	1997	bacterial model organism #1
<i>Caenorhabditis elegans</i>	100,300,000	1998	first multicellular animal genome
<i>Arabidopsis thaliana</i>	157,000,000	2000	first plant genome sequenced
<i>Homo sapiens</i>	3,200,000,000	2001	first draft sequence
<i>Polychaos dubium</i>	670,000,000,000	2008	largest known genome

Genome Architectures: Information Distribution

Central Cellular Roles of RNA

No tRNA processing
(RNase P) and protein
synthesis (ribosome)
without ribozymes

No protein coding
without mRNAs, no
eukaryotic mRNAs
without the
spliceosome

No protein secretion (4.5S
RNA/SRP) without structural
RNAs

No metabolite detection
without RNA aptamers

sRNA regulators: 6S RNA (binds RNA
polymerase), miRNAs (regulate cell
differentiation, cancer-involved)

Project Motivation: Making RNA Bioinformatic Tools Broadly Available to Non-IT-Specialized Scientists

- 1) Most RNA-related bioinformatic tools are available only for Linux but many scientists, especially in life-science research, are often not yet familiar with this smart OS
- 2) Many tools are computationally very expensive or difficult to handle in practice (command-line-based) and for many scientific aspects only few web servers are available

We like to not only follow up our own scientific projects but also allow others to use our distributed system by implementing appropriate job submission forms 😊

Our Initial Focus: The Problem of Identifying RNA Homologs

Primary structure comparison: virtually no similarity

PDB 1YSV: GGUAACAAUUAU-GCUAA-AUGUUGUUACC
unknown: GGGGCCCGGGG-AUACC-CCCCGGGCCCC
consensus: GG---C-----G---CC

Secondary structure comparison: identical hairpin fold

Tertiary structure: PDB 1YSV:
similar

A Solution: INFERNAL 1.0*

- 1) INFERNAL supports searching genomes for non-coding RNAs using a combination of primary and secondary structure information (SCFG/HMM-based)
- 2) Due to its extreme compute requirements, for serious bioinformatic analyses, INFERNAL is currently executed on high-performance computing clusters, only (CMCALIBRATE run times on a 2.4 GHz Intel Centrino P8600 CPU vary between 14 min to 72 hrs with seed alignments taken from Rfam 9.1)

Achievements: Server Setup, Client Implementation, Alpha Testing, Screensaver Creation

Automated Results Archiving in a Publically Accessible Drupal/MySQL-based Web Database, OpenMPI Implementation, Construction of User Job Submission Forms

The screenshot shows a web browser window displaying the RNA World database interface. The page title is "Organisms in the RNAWorld database". The main content area shows details for the organism "Deinococcus deserti VCD115".

Organisms in the RNAWorld database

Details for *Deinococcus deserti* VCD115

Organism Name	Deinococcus deserti VCD115
Last Update	2009-09-25 13:31:53
Genome File	Deinococcus-deserti-VCD115_CP001114.cir.EMBL.dna
Fasta File	

RNA in this Organism

This Organism has RNA from 6S (RF00013_6S[Rfam-9.0]_seed) :

Details

Potential Candidate	Strand Type	Start	End	Score	E [▲]	P
1	plus	491817	491941	10.91	5.312	3.468e-06
66	minus	2808259	2808395	9.28	13.6	8.881e-06

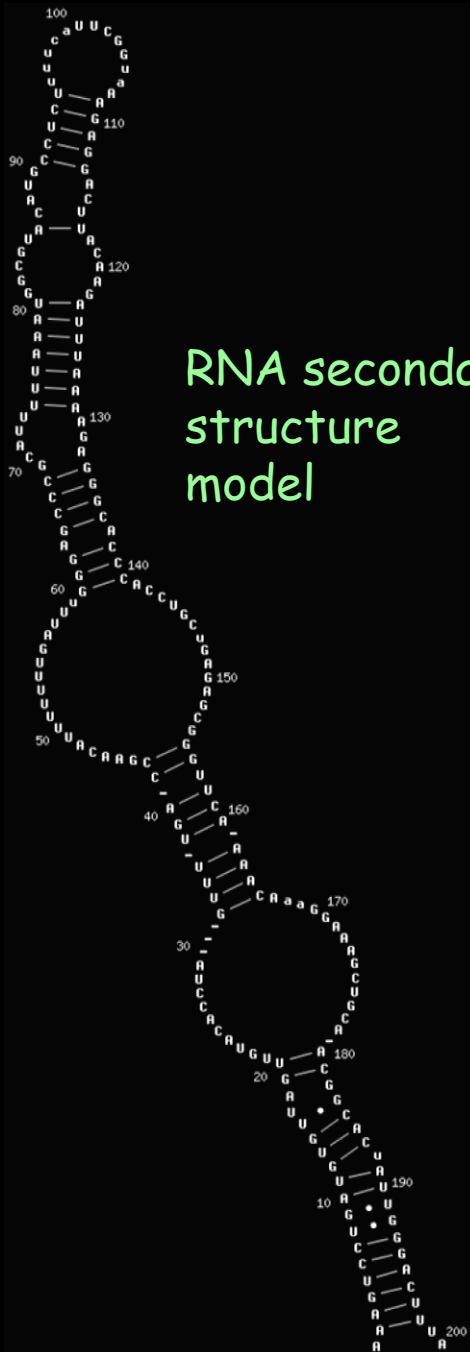

OpenMPI: searching DsrA in *M. tuberculosis* on a Quad-Opteron/2.6 GHz/Linux-32:

```
-----  
# of cores: 1, total actual time for CMCALIBRATE: 02:18:27, CMSEARCH: 00:28:08  
# of cores: 2, total actual time for CMCALIBRATE: 01:33:18, CMSEARCH: 00:28:08  
# of cores: 3, total actual time for CMCALIBRATE: 00:39:50, CMSEARCH: 00:14:05  
# of cores: 4, total actual time for CMCALIBRATE: 00:26:45, CMSEARCH: 00:09:41
```

Problems & Useful Improvements

- 1) Initial (funny) validation issues: rounding is different in Linux & Windows: ASCII files containing floating point numbers cannot be validated when the WU is computed once under Linux and the other time under Windows
- 2) RNA World checkpointing currently works exclusively for Linux-32 machines and requires manual adjustments from a superuser: if BOINC could in the future run as a virtual machine, universal checkpointing would be possible where the science application has to take no measures to achieve this (most existing science applications cannot support checkpointing without entire re-coding, including INFERNAL) 😊
- 3) RNA World screensaver is currently implemented as a series of randomly selected flash movies: a universal (cross-OS) movie template/player would be very helpful to avoid diving deeper into graphics programming 😊

Future Perspectives

fully automated
